

Appsus

Your 2 favorite apps in one place

Your challenge is to create a single page application with a set of mini apps:

mister**Email**, miss**Keeper**

The specification for each app is given in a separate document.

Appsus shall “encapsulate” the three apps and provide a nice browsing between them.

Services load data from localStorage and provide an API with promises.

The result should be functional, beautiful and responsive.

Learn and setup

Review together our last CRUD project

Create folder structure for the project

Setup git and make sure the team can push and pull from the repository

Recommended Workflow

Learn the definition documents and make a plan regarding the structure and work methods together

Design the structure of the Appsus app and create it as an “empty” app – a structure to work in at the project, including pages, routing, main components, services.

Commit and Push, make sure it works for the team members

Implement your Keeper app inside its page and make sure it works inside of the Appsus app

Split and work separately and together whenever you see fit.

Try to push and pull every few hours to coordinate your code and practice the workflow/ Do the first push/pull together

Use this opportunity to improve the code by mutual code reviews
